Marisol Sepulveda

Associate Head for Research and
Professor of Forestry and Natural
Resources, Purdue University

Dr. Marisol Sepúlveda is a Professor of Ecotoxicology in the Department of Forestry and Natural Resources at Purdue University. Her work focuses on understanding how environmental contaminants affect the health of wildlife and ecosystems, bridging toxicology, ecology, and veterinary science to address complex environmental challenges. She is also co-lead of the PFAS Strategic Research Team with ISF.

Dr. Sepúlveda's research centers on ecotoxicology, with a focus on the effects of environmental contaminants on fish and wildlife populations. Her work examines a wide range of pollutants—including heavy metals, pesticides, industrial chemicals, and emerging contaminants such as PFAS—and their impacts on biological systems.

By integrating veterinary science with environmental toxicology, her work strengthens the ability to diagnose, monitor, and mitigate the impacts of pollution on wildlife populations, contributing to more informed environmental policy and management decisions.
